EISENHOWER MATRIX TEMPLATE in Google Docs

HIGH

LOW

URGENT

DO

These are vital tasks with substantial urgency.

- Add & Track Inventory Items: Create a basic interface to log new equipment (balls, nets, cones) with unique IDs and names.
- Status Toggle (Check-Out / Return): Implement core logic to toggle an item's availability state between Available and Checked Out.
- Dashboard View & Persistence: Display a clean console table of all current gear and save/load item states using a local CSV file.

SIGNIFICANT

SCHEDULE

These are critical tasks with minimal urgency.

- Console Table Formatting: Use built-in Java string formatting or lightweight CLI layout helpers instead of building custom UI alignment logic from scratch.
- CSV Parsing & File I/O: Rely on standard Java utilities (Scanner, BufferedReader, PrintWriter) rather than writing manual byte-level storage handlers.
- Input Validation & Parsing: Use standard Java regex and wrapper methods to handle bad user menu inputs safely.

NOT URGENT

DELEGATE

These are pressing tasks with negligible impact.

- Borrower History Logs: Track borrower names, check-out dates, and expected return dates for past transactions.
- Role-Based Access Control: Implement Staff vs. Admin login views to restrict who can delete or edit item records.
- GUI / Mobile Web Wrapper: Build a graphical user interface or web dashboard for easier mobile use in the field.

INSIGNIFICANT

DELETE

These are trivial tasks with minor urgency.

- Multi-Park Real-Time Syncing: Skip complex cloud database synchronization across multiple city park facilities.
- Barcode / RFID Scanning: Omit physical barcode scanner hardware integration for item tags.
- SMS / Email Overdue Alerts: Cut automated SMS or email notification services for late equipment returns.
